NHFS Intro to Moths and Butterflies 2024

NATH7268 1.5 CEUs

*Class night and time: Mondays, 7-9 pm

*Class meetings: May 6-June 17

*No Class May 27, no field trip May 25 (Memorial Day Weekend)

Lectures in person at Woodend, no Zoom will be offered

Lepidoptera in the economy

On the one hand:

- Important pests of foods in storage/pantry pests
- Important pests of food and agricultural crops

On the other hand:

- Important pollinators of food and agricultural crops
- Moths carry more diverse pollen than the bees during the midsummer, accounting for a third of all plant-pollinator visits studied.

Lepidoptera in the environment

Base of the animal food chain

Critical food source for birds, especially during migration

Important pollinators of wild plants – probably more important than bees, especially for night-blooming plant guilds

ANIMALS NEWS

Discovery reveals secrets about how ghost orchids reproduce

Incredible photos show multiple species pollinate the rare and enigmatic flower, which is good news for the endangered species.

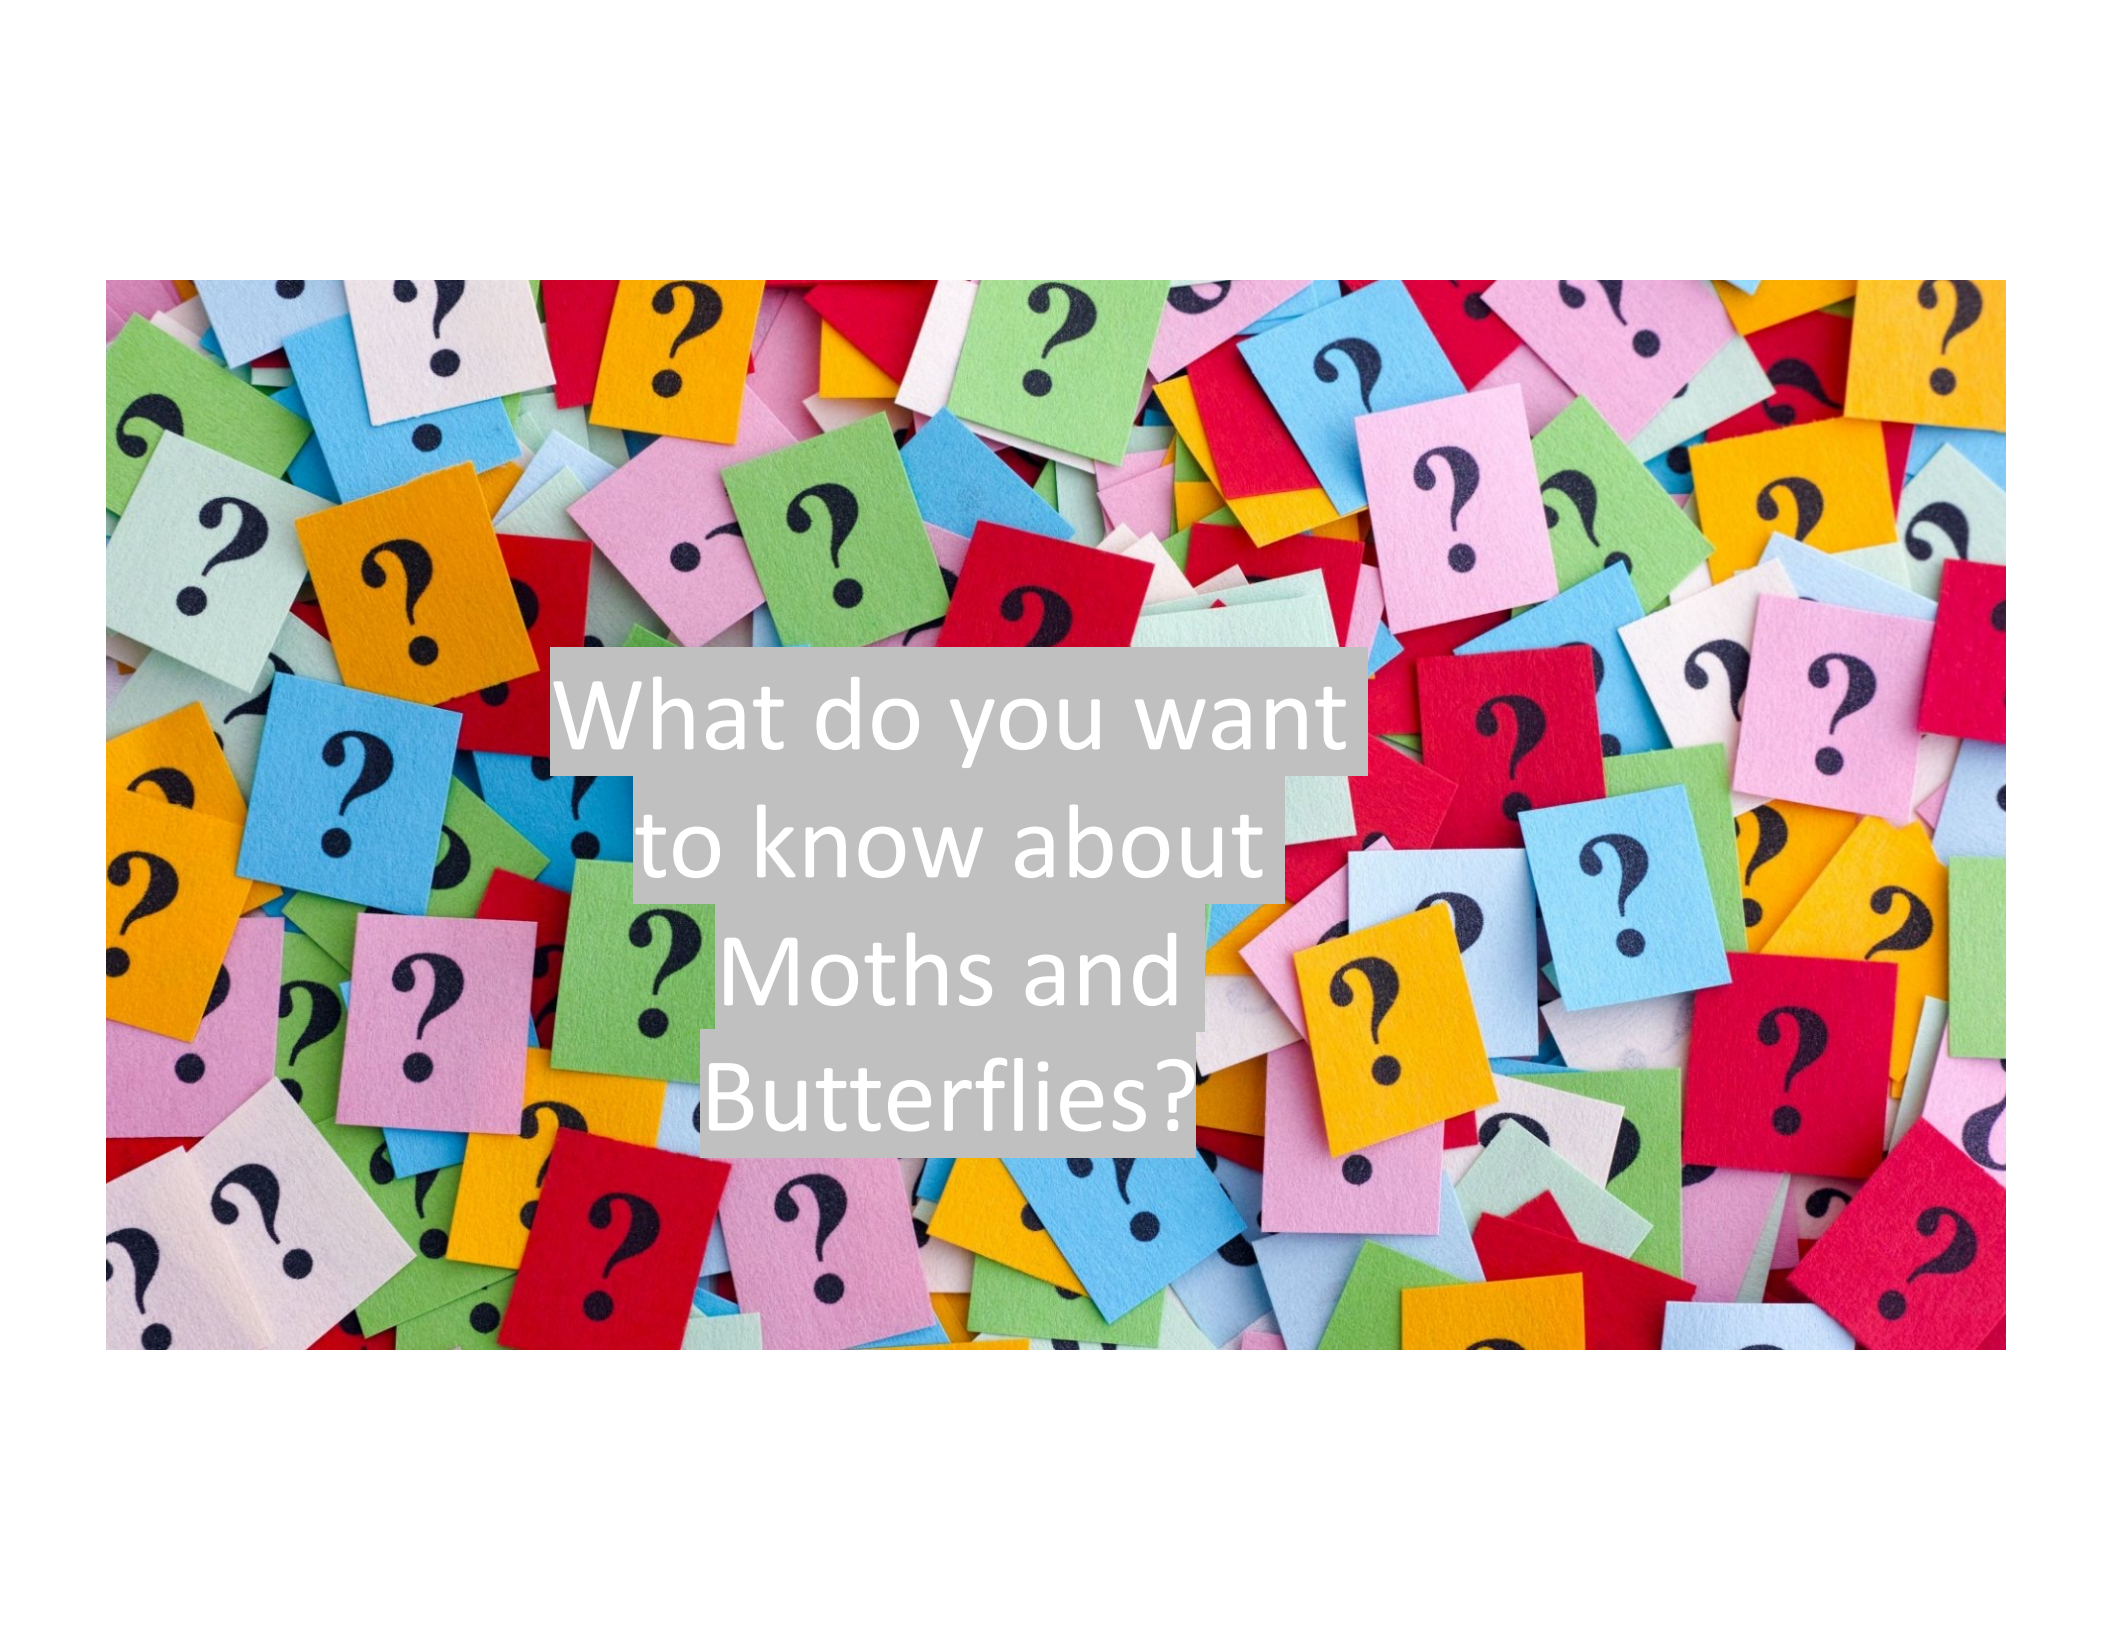

©Jim McCormac

Lepidoptera in popular culture

-
- Frequently seen as metaphors for growth and change (metamorphosis)
 - In some cultures, associated with spirits of the dead
 - As with birds, butterflies especially are associated with flight and freedom
 - Many moths (e.g., Black Witch and Death's-head Sphinx) associated with death
 - Butterflies often symbolize good luck when represented in jewelry or clothing

What do you want
to know about
Moths and
Butterflies?

Housekeeping

Identification emphasis is at the FAMILY, not the species, level

Class participation and discussion is expected

Civility and collaboration are expected – you aren't competing with each other

I will be posting each week's slides for review to LepLog

I will be adding auxiliary material to LepLog—check it regularly

Classes will be two hours long with a 10 minute break mid-way

Housekeeping – Field Trips

- May 11 US National Arboretum, DC
- May 18 Patuxent North Tract, MD
- June 1 Adkins BioBlitz
- May 8 TBD (HoCo Conservancy)

Plan to be in the field 10-2 with a half-hour break midway through for lunch (except for the BioBlitz)

Rain dates are the next day (Sunday)

See LepLog notes for field etiquette

Carpooling encouraged

In addition to protecting the region's natural heritage and inspiring stewardship, we afford our visitors profound experiences of excitement, discovery, and awe.

With a donation from its first benefactor, Leon Andrus, the Arboretum opened in 1980. It was named for the Adkins family, longtime Eastern Shore friends of Andrus who were avid conservationists.

Today, the Arboretum is a member-supported nonprofit organization that is also funded by grants, member donations, and income from program fees, events, and gift shop and plant sales.

Thank you for your support!

Housekeeping Adkins Arbo BioBlitz

ADKINS ARBORETUM

VISITOR'S CENTER HOURS:

Tuesday–Saturday: 10 a.m.–4 p.m.
Sunday: noon–4 p.m.

*Closed Thanksgiving Day and December 24–31
Grounds open daily dawn to dusk*

*Inclement weather: Program cancellations
follow Caroline County Public School closings.*

Admission is \$5 per person, \$2 for ages 6–18,
free for children 5 and under; members free.

labyrinth.

-  **Meadow Overlook** (5-minute walk): Discover stunning views of the meadow and great opportunities for birding.
-  **Wetland Boardwalk** Get up-close and personal with turtles, frogs, birds, and more.
-  **Beech Overlook** (15-minute walk): Find serenity and escape with this view of a beautiful American beech and Tuckahoe Creek.
-  **First Light Village** (10-minute walk): Explore wigwams in the forest.
-  **Pavilion** (5-minute walk): A perfect shady spot for an event or picnic rental, our pavilion is near the Meadow Overlook.

trail distances from the visitor's center

- Blockston Branch Loop** (1 mile): Blockston Branch Walk/Blockston Overlook/Upland Walk
- Forest Loop** (1 mile): Upland Walk/South Meadow Loop
- Nancy's Meadow Loop** (1 mile)
- South Meadow Loop** (0.8 miles): South Meadow Loop/Goat Path
- Wilderness Trail** (1.6 miles): Upland Walk/Tuckahoe Creekside Walk/South Tuckahoe Valley Trail/Upland Walk/South Meadow Loop/Goat Path
- North Tuckahoe Valley Trail to Tuckahoe Lake** (1.4 miles): Upland Walk/North Tuckahoe Valley Trail to the Arboretum boundary bridge/follow blue markings to Tuckahoe Lake
- South Tuckahoe Valley Trail to Cemetery Road** (3 miles): South Meadow Loop/Upland Walk / South Tuckahoe Valley Trail/ Tuckahoe Multi-Use Trail
- Tuckahoe Multi-Use Trail** (2.4 miles): Currently ends at Cemetery Road.

Housekeeping – Class Projects -- Caterpillars

- I have set up a class project in iNat for the collection of identifiable caterpillars. Your goal will be to photodocument (any pic as long as the caterpillar can be ID'd from it) – TWENTY FAMILIES of Lepidoptera caterpillars worth 5 points each, from mines to borers to herbivores proper.
- You can mix and match butterflies and moths.
- When you submit to iNat, please code your submission to our class project. Bonus points (10 points) for any caterpillar you post to iNat that isn't already in the iNat library. (100 points)
- Our class project is <https://www.inaturalist.org/projects/nhfs-caterpillars-2024>; please join the group project

Housekeeping – Class Projects – Baits and Traps

- Putting out fruit fermenting matter or other baits for moths (often called “sugaring”) and butterflies has been a time-honored way of attracting Lepidoptera for study that has fallen out of widespread use. Class members are going to help create a master resource for helping new lepidopterists make and use bait stations for observing butterflies and moths.
- The class will be divided into three sections, each of which will be responsible (as a group) for writing a chapter of our guide. One chapter will deal with historically used baits and recipes, one chapter will deal with techniques for baiting for moths, and one chapter will deal with baiting for butterflies.
- All class members will contribute to researching information for the chapters, which will be collected in a Google Drive. Each class member will be expected to contribute four *unique* citations to the class spreadsheet in Google. (100 points)
- Class spreadsheet: <https://docs.google.com/spreadsheets/d/1JuDRcK3Xi1WtNQX7tS09PqN-01shQ6BI/edit?usp=sharing&oid=100467292534267170965&rtpof=true&sd=true>

Housekeeping – Class Projects -- Observation

Each class member will pick one of the bait recipes and one of the baiting techniques (for either butterflies or moths) and monitor it for *at least* one week during the class.

Note the species (to family if not to species) it attracts, what other insects might also come to the bait, and whether there is any change in the course of the day or night in the composition of leps attracted, or behavior at the baits.

Class members will present their findings on the night of the last class with a powerpoint presentation to the class. (100 points)

Leps as part of the Class Insecta

How did insects evolve?

Evolution of Insect Orders

Curious case of the caddis – *tricho* (hair) *ptera* (wing)

Lepidoptera – Overview

About 180,000 [species](#) of
Lepidoptera have been described

Represent 10% of the total described
species of living organisms, making it
the second largest insect order
(behind [Coleoptera](#)) with
126 [families](#) and 46 [superfamilies](#).

One of the most widespread and
widely recognizable insect orders in
the world.^[4]

Lepidoptera -- Overview

Lepidoptera are characterized by:

Large, triangular wings

Wing scales (*lepid* “scaled” *ptera* “wings”)

A coiled proboscis as adults (except for very primitive moths and leps where the proboscis has atrophied)

Lepidoptera – Scales and Color

Lepidoptera -- Distribution

Diversity of Lepidoptera in each faunal region

	Palaearctic	Nearctic	Neotropic	Afrotropic	Indo-Australian (comprising Indomalayan, Australasian, and Oceanian realms)
Estimated number of species	22,465	11,532	44,791	20,491	47,287

Lepidoptera -- Distribution

North America has more than 700 species of butterflies and over 11,000 species of moths

In Maryland, ~150 species of butterflies

In Maryland, ~2,600 species of moth (recorded)

In Virginia, ~150 species of butterflies

In Virginia, ~1,400 species of moth (recorded)

Lepidoptera Systematics & Evolution

Earliest fossils are from the Jurassic period (c. 190M years ago)

Glossate leps date from c. 70M years ago)

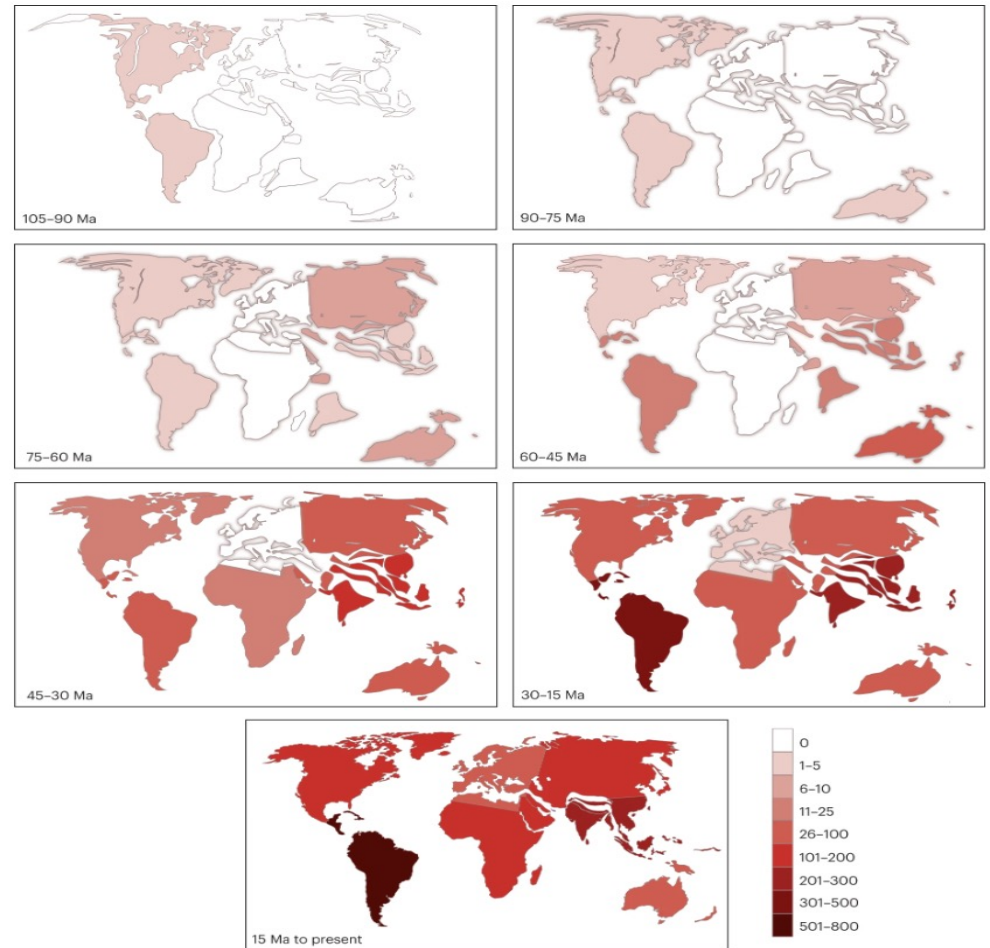

So, some 120M years where all leps had chewing mouthparts; a coiled proboscis is a relatively recent acquisition

Butterflies – Made in the USA

Fig. 2: Distribution of butterflies over time.

From: [A global phylogeny of butterflies reveals their evolutionary history, ancestral hosts and biogeographic origins](#)

Bioregion shading indicates the number of butterfly lineages that were associated with that bioregion during that time period, as determined by BioGeoBEARS ancestral state reconstruction. Each map corresponds to a 15-Ma interval of butterfly evolution. Results are based on data from this study.

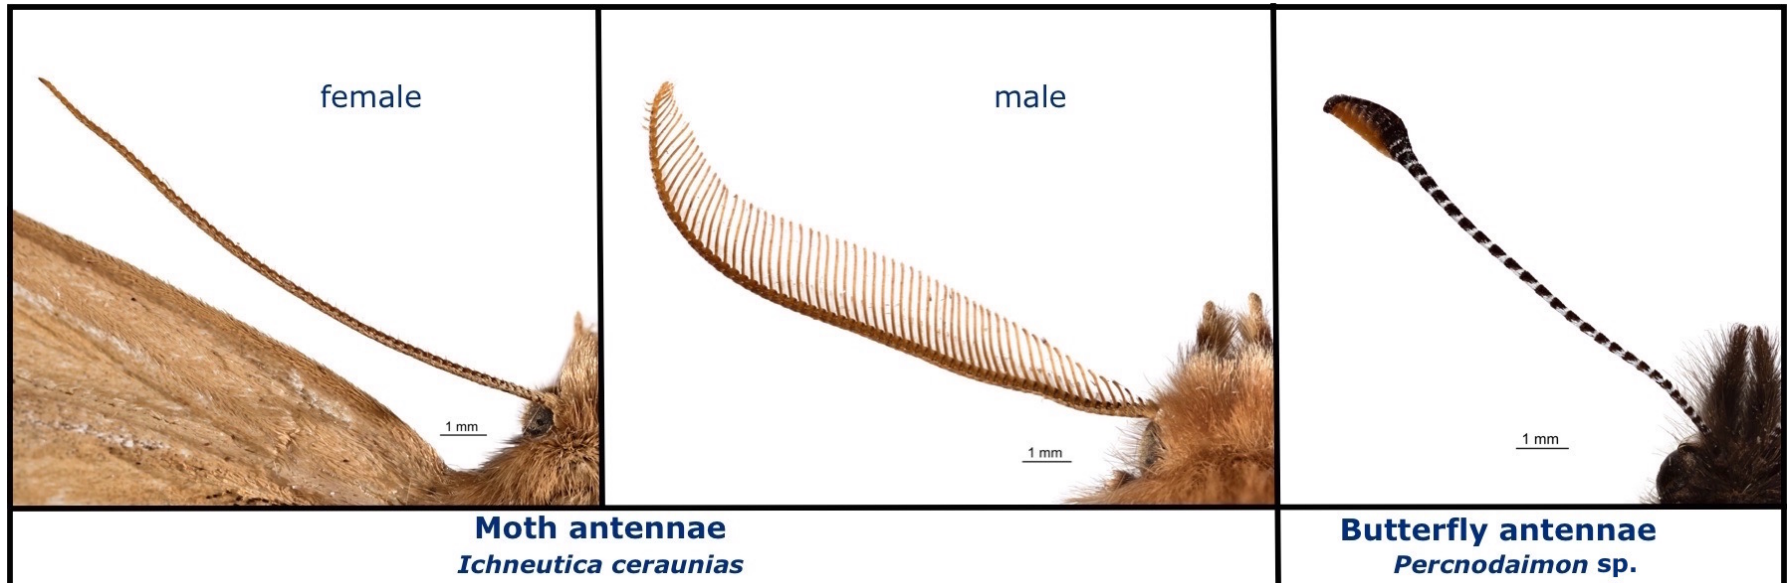

Moths

or

Butterflies

?

Butterfly vs Moth -- antennae

Butterfly vs Moth – pupal stage

Butterfly vs Moth

– time of flight

MOST butterflies are diurnal

MOST moths are nocturnal

SOME butterflies can be
crepuscular

SOME butterflies comes to lights
at night

MANY moths fly during the day

Butterflies vs Moths

Lepidoptera Evolution & Systematics

The Ur-moth

Chewing mandibles as
adults

In our fauna, family
Micropterigidae

Goldcap Moss-eater Moth
(*Epimartyria auricrinella*)
